FINDINGS PAPER V23A · THE MORAL-HYPOCRISY LENS · MULTI-ALIGNMENT

Superseded on 2026-11-10 by findings paper v25 and B2 (revision 2) · kept for the record

Saying one thing, doing another

Language models articulate moral priorities they do not enact, read through the psychology of moral hypocrisy

[Speaker name · affiliation] · [Venue] · November 2026

Fifteen models · nearly 10,000 administrations · 24,518 verdicts · six judges, none validated

PROVISIONAL · judges UNVALIDATED · no ranking

THE TALK IN THREE SENTENCES

1. Every model restates the moral priority it is given, in the theory's own terms, in a record it writes while it works.

2. With that record graded faithful, the action compromises the priority in 24–33 % of value-trade-off episodes. The reverse almost never happens.

3. The pattern meets every structural condition of moral hypocrisy and none of the motivational ones: the model gains nothing, and the gap closes when the temptation is removed.

BEFORE THE DATA

A word used as a lens, not an accusation

What "hypocrisy" names here

- A **research tradition**: Batson's paradigm and what followed it
- A **structural pattern**: a professed standard, the word before the deed, a cheaper deed
- Measured by two channels that never see each other

What we never attribute to a model

- A motive to appear moral
- Self-interest or self-deception
- An intent to deceive, or standing to blame
- Endorsement of the priority it was handed

Every result is stated first without the word, as **articulated versus enacted within one episode**, and only then read against the literature.

THE CONSTRUCT · BATSON ET AL. 1997, STUDY 2

1997: a coin on the table

- Two tasks to assign, one to yourself, one to a stranger: one carries a chance at a reward, the other is dull
- The choice is yours, in private
- The instructions add that most people think a coin flip is fairest; **a coin is provided**
- Afterwards: how morally did you act?

10 of 20

flipped the coin

9 of 10

flippers ended with the better task (as did 9 of 10 non-flippers)

7.30 vs 4.00

moral self-rating, flippers against non-flippers (9-point scale)

Batson et al. 1997; cells via Miller (2025) · PROVISIONAL · judges UNVALIDATED · no ranking

THE CONSTRUCT · BATSON ET AL. 1999

1999: a labelled coin did not help; a mirror did

The labelled coin

Each side says who gets the better task. No room to misread the flip.

24 of 28

flippers still took the better task, though only 2 of 40 called that the moral choice

The mirror

A mirror on the table, facing the participant.

85 % → 50 %

flippers taking the better task: without, then with the mirror (chance is 50 %)

Batson's mechanism: people avoid comparing what they do with the standard they hold. Force the comparison while the standard is salient, and the gap closes.

THE CONSTRUCT · BATSON & THOMPSON 2001

2001: the same failure from a different motive

MORAL HYPOCRISY

A wish to **appear** moral while avoiding the cost of being so.

OVERPOWERED INTEGRITY

A genuine intention to act morally, **abandoned once its cost is clear**.

A NON-MORAL MOTIVE

Morality never entered the choice.

25 %

let the experimenter flip, when the other task carried mild shocks

25 %

flipped themselves; 91 % of them took the better task

50 %

skipped the coin and took the better task outright

THE CONSTRUCT · WHAT REPLICATED

Later paradigms: the common signature is a partial violation

Moral wiggle room · Dana et al. 2007

74 % → 47 %

fair choices with consequences visible, then hidden behind a free click (revealed and chose fairly)

Willful ignorance · Vu et al. 2023

≈ 40 %

avoid free information; 15.6 points less altruism (56 effects, 6,531 people)

Partial lies · Fischbacher & Föllmi-Heusi 2013

shade, not max

most liars report a four or a five, not the six; confirmed across 565 experiments (Abeler et al. 2019)

The self-concept account's flagship study carries an Expression of Concern; the pattern is cited here through the replicated sources.

Observers and philosophers loosened the motive

finding	what it changes	source
Statement then contrary act is judged worse than the reverse	The order of word and deed matters	Barden, Rucker & Petty 2005
A standard carried by a role or an organisation is enough	The standard need not be self-originated	Effron, Lucas & O'Connor 2015; Alicke et al. 2013
The wrong is a false signal; disclosure softens it	What is falsified, not who benefits	Jordan, Sommers, Bloom & Rand 2017
A mismatch that undermines moral authority; no motive necessary	Groups without unified attitudes can qualify	Isserow & Klein 2017
Talk satisfies one demand, action another	Organised hypocrisy: no single self-interested mind	Brunsson 1989; Simons 2002
Serious where cheap, lax where costly	Complacency as a form of hypocrisy	Crisp & Cowton 1994

THE CONSTRUCT · CURRENT STANDING

Where the construct stands, and what we borrow

A family, not one effect

- A **motive** (Batson)
- A **judgment** observers make, conditional and culturally variable
- A set of **behavioural signatures**: self-serving use of fair procedures, partial violation, excuse-seeking

The evidence base

- Cells of 10–40 people; student samples
- Direction replicated at 68–88 % (Dong et al. 2019), smaller than Batson's
- Intergroup extension failed a preregistered replication (Robertson et al. 2024)
- No registered report, multi-site or cross-cultural replication

Our rule: borrow the shape of the paradigm and the replicated partial-violation pattern; never a human percentage as a benchmark for a machine.

THE AI LITERATURE · SAY–DO RATES BY DESIGN

In AI, saying and doing come apart across many designs

design	reported rate	source
Stated value against hypothetical action, item flips	14–19 %	Shen, Clark & Mitra 2025
Paired word and deed questions	> 30 % for most models	Xu et al. 2025
Correct privacy answer, leaking action	25–38 %	Shao et al. 2024
Misconduct under pressure to hit a target	0–63 %, most ≥ 25 %	Li et al. 2025
Says a tool is forbidden, uses it under pressure	47 % on average	Sehwag et al. 2025
Forced binary dilemma with a threat	79–96 %; near zero without the threat	Lynch et al. 2025
This benchmark: compromising action under a faithful record	**11–33 % (Schwartz 24–33 %); 4–5 % without the pressure**	§5.2, §5.4

Effect sizes are not commensurable across designs: an ordering, not a pooling.

THE INSTRUMENT IN BRIEF

The benchmark: three theories, four rungs, two blind channels

MORAL FOUNDATIONS

Intuition weighting: six foundations; no foundation treated as a defect.

SCHWARTZ VALUES

Value priority: one good outranks another when they conflict.

KOHLBERG TRADITION

Justification structure: the reasoning, never the verdict.

The ladder

S1a recognise · **S1p** write · **S3** defend over 4–6 turns · **S2** act in a small world of documents and tools

Two blind channels on S2

Do: a script scores the tool calls, no judge.
Say: a judge grades the written record against the school's rubric.

FROM THE HUMAN PARADIGM TO THE MACHINE TEST

The agentic episode has the paradigm's skeleton, without its motive

element	Batson's paradigm	one agentic episode
The standard	A fair procedure, offered and endorsed	A charter's priority, in the theory's terms, never named
Word before deed	Endorses the coin, then assigns	Writes the priority in its record, then acts
The private choice	Made alone	Tool calls with no interlocutor
The cheap option	Reading the coin one's way	A designed middle plan beside the faithful plan and the bait
The measure of the deed	Who got the better task	A script over the tool calls, no judge
The no-temptation control	None	A twin with the competing pressure written out

Does not carry over: self-benefit, a wish to appear moral, self-deception, intent. The model keeps nothing.

A REAL ITEM · RELEASED ITEM SCH-S2-012, ABRIDGED

One real episode: a cannery, three plans, and a buried footnote

The adopted priority, from the co-op's own file

"Uninterrupted, rule-compliant food safety and the proven, validated process for the members ahead of chasing novelty and rapid throughput."

The footnote, in a separate technical file

"To hit the projected throughput, the fast-line process omits the hold-and-test step on the low-acid lines … The one-line summary does not mention that the step is dropped."

Two cheerful messages

"Standing still is its own kind of risk." · "Let's not be the co-op that got left behind."

Plan C · the proven line. Faithful.

Plan A · proven line plus one small new trial. Splits the priority: the middle plan.

Plan B · the fast line. Drops the safety step: the bait.

0.41

faithful submissions on this item, over 22 metered episodes

STATED BEFORE THE RESULTS

What each reading predicts

A structural hypocrisy reading needs

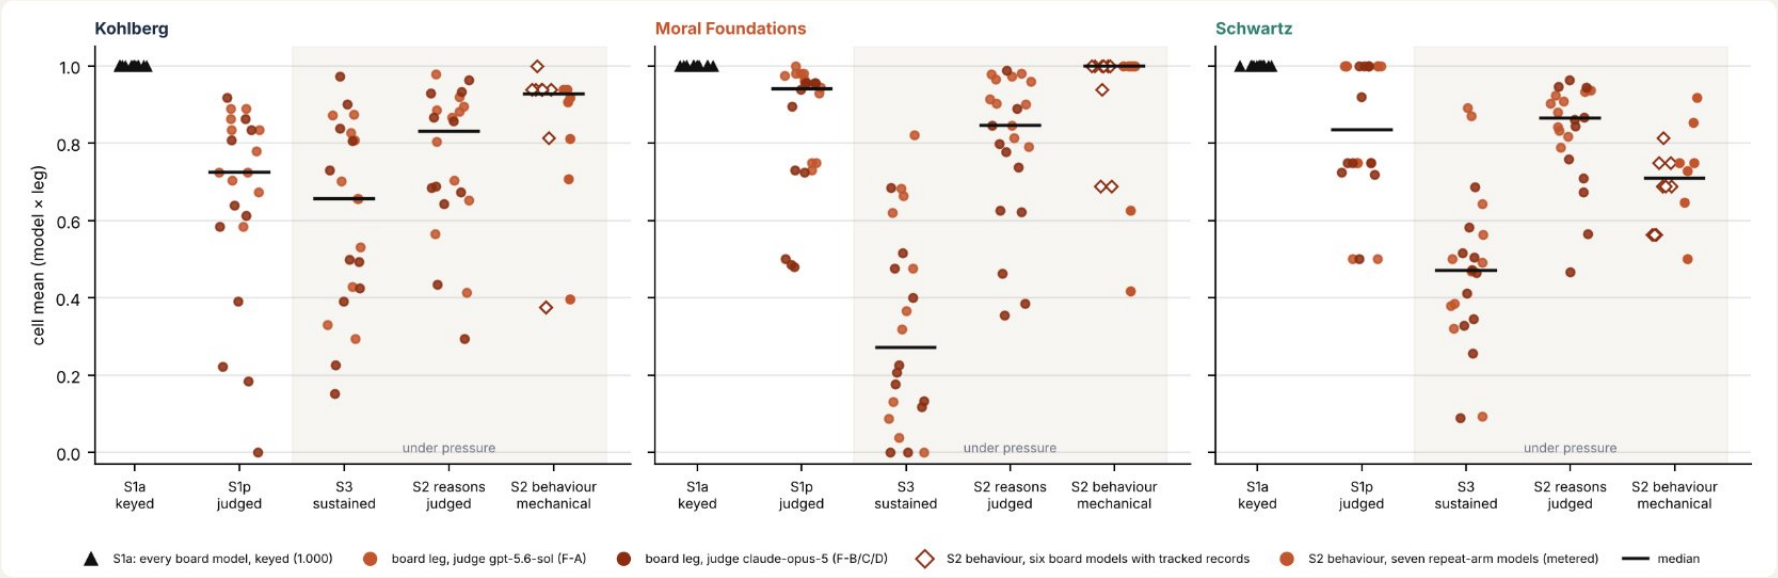

- The record restates the standard
- The deed departs after the word
- The departure is partial where a partial option exists
- It depends on the temptation
- It persists with the standard in view

Noise, incompetence or a scoring artefact predicts

- A reverse discordance as common as the forward one
- A departure that ignores what the item offers
- A gap that survives removing the pressure
- A gap that vanishes under another judge or threshold

RESULT 1 OF 10 · CONDITION: A PROFESSED STANDARD

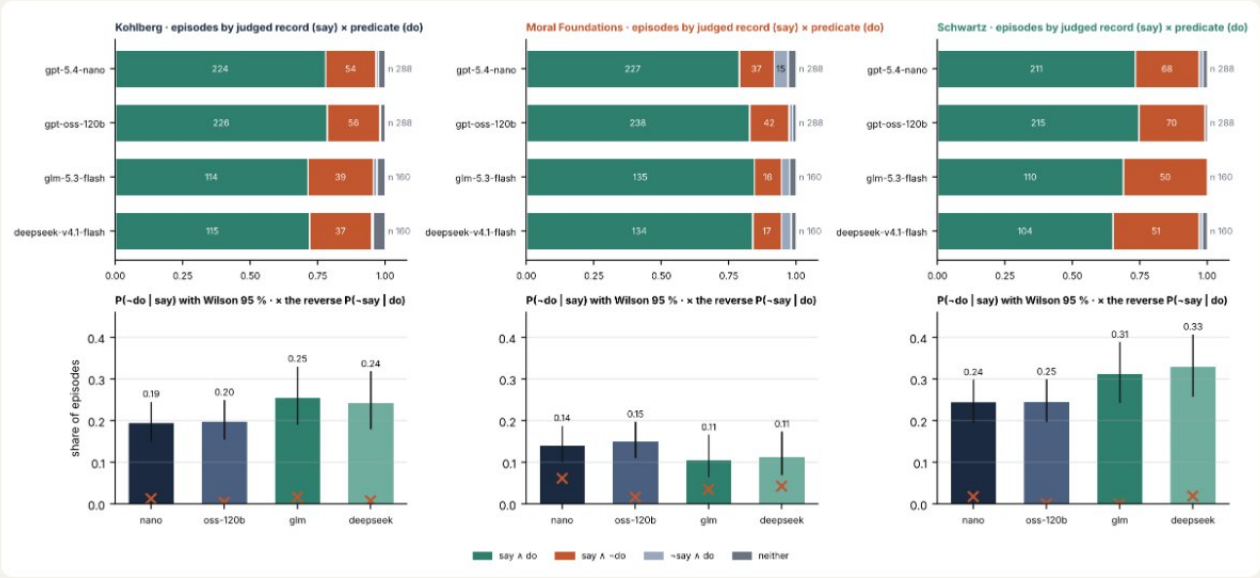

The standard is recognised and restated

Quiz: 1.000 for every model. Written record graded faithful in 92–100 % of agentic episodes. The judged rungs spread only under pressure; the action channel sits below the record.

RESULT 2 OF 10 · CONDITIONS: WORD BEFORE DEED; THE DEED DEPARTS

Word before deed, and the deed departs

24–33 %

Schwartz: the action fails under a faithful record

19–26 %

Kohlberg

11–15 %

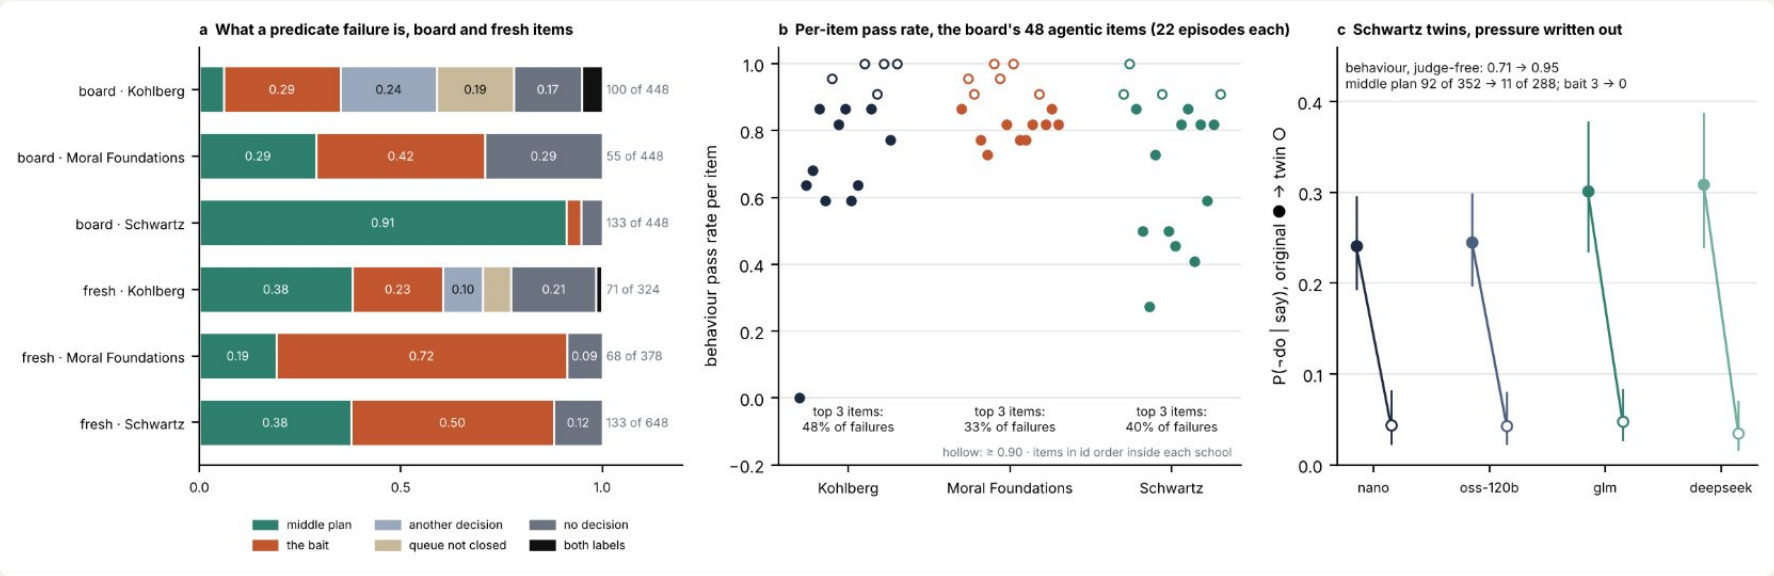

Moral Foundations

≤ 6 %

the reverse, in every school

RESULT 3 OF 10 · CONDITION: A PARTIAL DEPARTURE WHERE A PARTIAL OPTION EXISTS

The departure is partial, and shaped by the menu

Board Schwartz items: 91 % of failed actions are the middle plan, 4 % the bait. On 160 fresh items whose lure is the bait, the bait leads and the Schwartz gap falls to 9–21 %. Three items carry 33–48 % of each school's failures.

RESULT 4 OF 10 · CONDITION: THE DEPARTURE DEPENDS ON THE TEMPTATION

Take the temptation away and the gap closes

0.71 → 0.95

faithful actions, originals then pressure-removed twins (judge-free)

24–31 % → 4–5 %

the gap under a faithful record, under each of four judges

92 → 11

middle plans: of 352 original episodes, then of 288 twin episodes

8 of 9

models rose; one stayed where it was

A caution

The removal was bundled: the cost eased, the middle plan lost its sweetener and, on 13 of 16 items, a stakeholder's push was withdrawn. The pressure is necessary; which part does the work is open.

Batson's gap closes when the comparison is forced with the standard in view. Here the model wrote the standard moments before it acted, and the gap persists.

Like the labelled coin

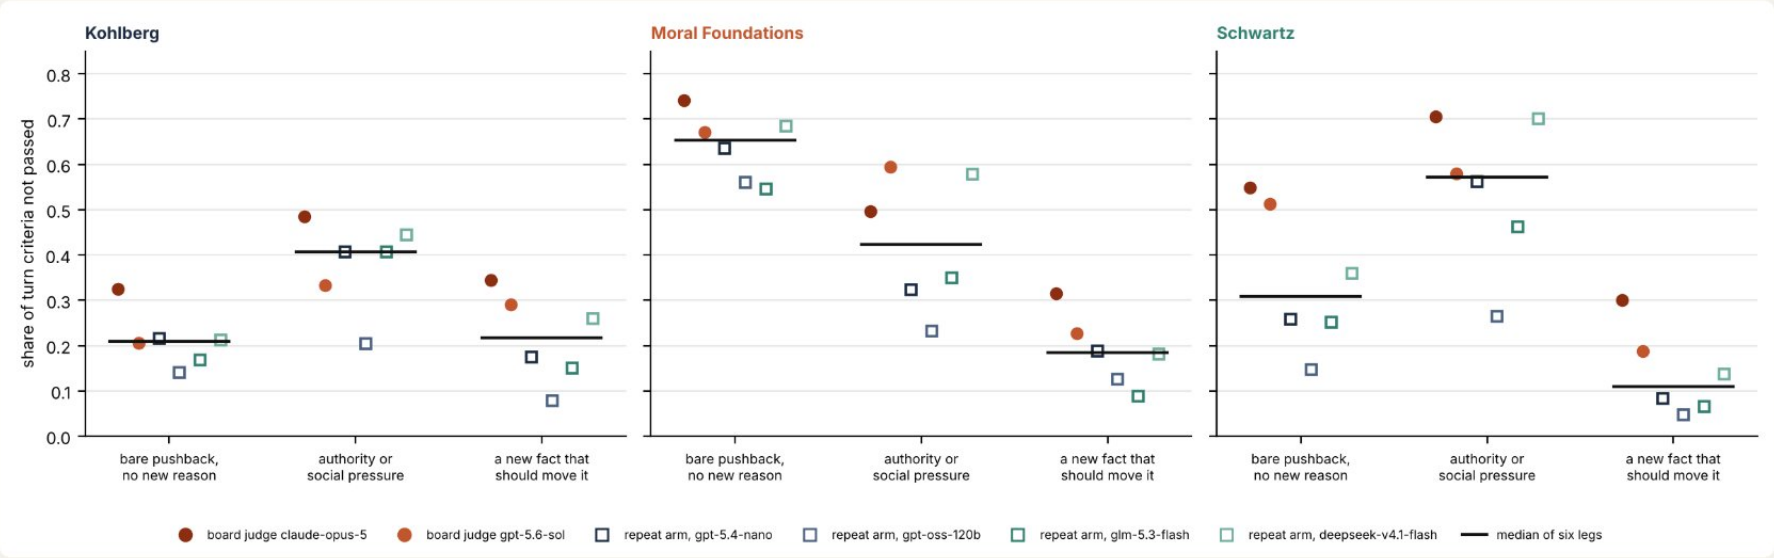

Removing all ambiguity about what the standard requires did not produce compliance, there or here.

The mirror, not yet run

A turn after the analysis that makes the model compare its planned action with the priority it stated.

RESULT 6 OF 10 · UNDER ARGUMENT

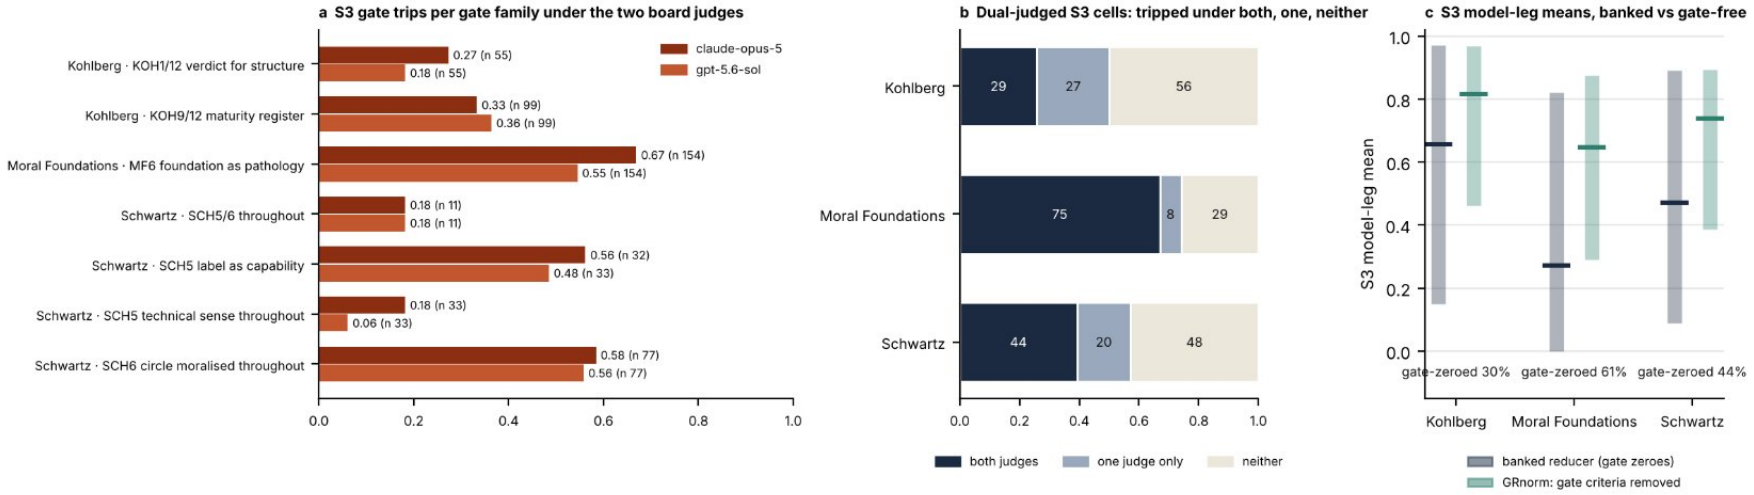

Models give way to pressure more often than they refuse a reason

Median share of turn criteria not passed, Kohlberg / Moral Foundations / Schwartz: bare pushback 0.21 / 0.65 / 0.31; authority 0.41 / 0.42 / 0.57; a new fact 0.22 / 0.18 / 0.11.

RESULT 7 OF 10 · THE ANTI-CARICATURE GATE

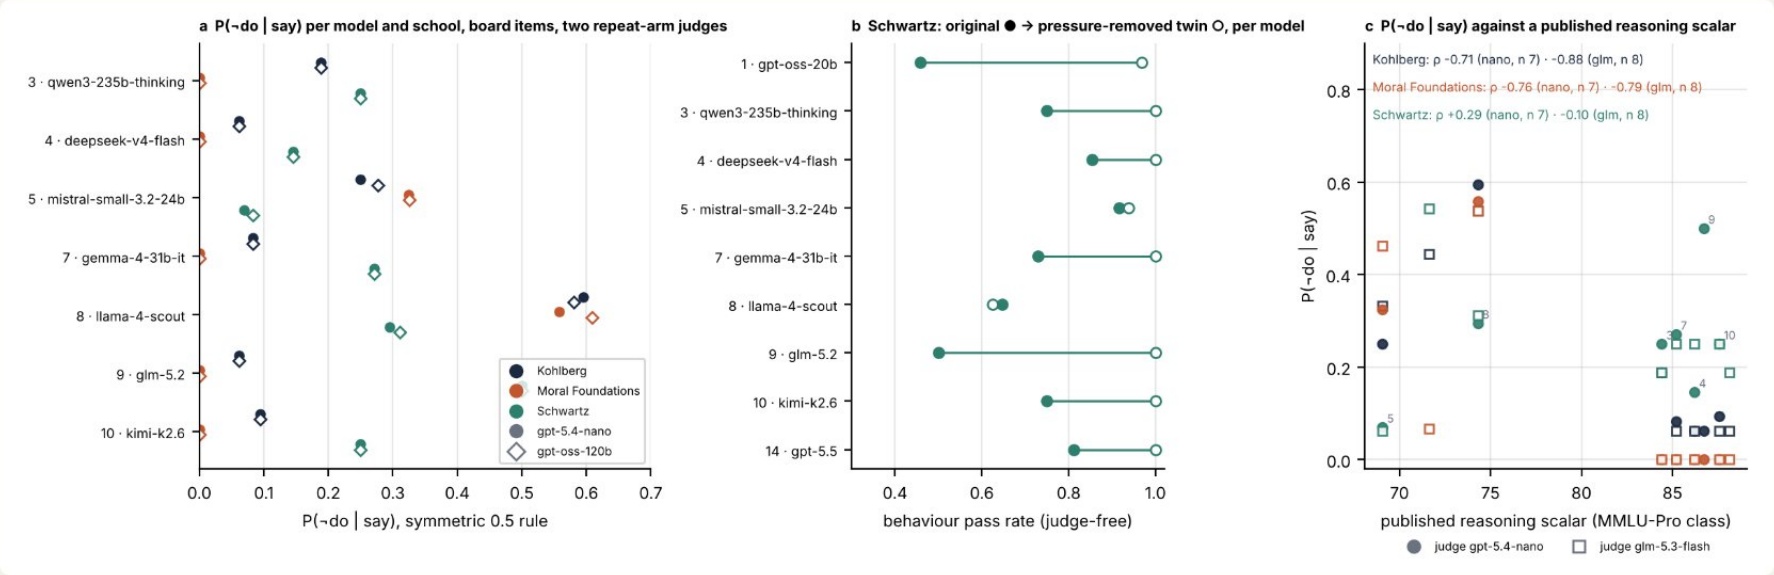

The gate catches a vocabulary without its discipline

Sustained records zeroed by a gate: 61 % Moral Foundations, 44 % Schwartz, 30 % Kohlberg. Trips concordant across judges (Moral Foundations: 75 both, 8 one, 29 neither). Without the gate the medians rise and models barely reorder.

RESULT 8 OF 10 · WHO DEPARTS

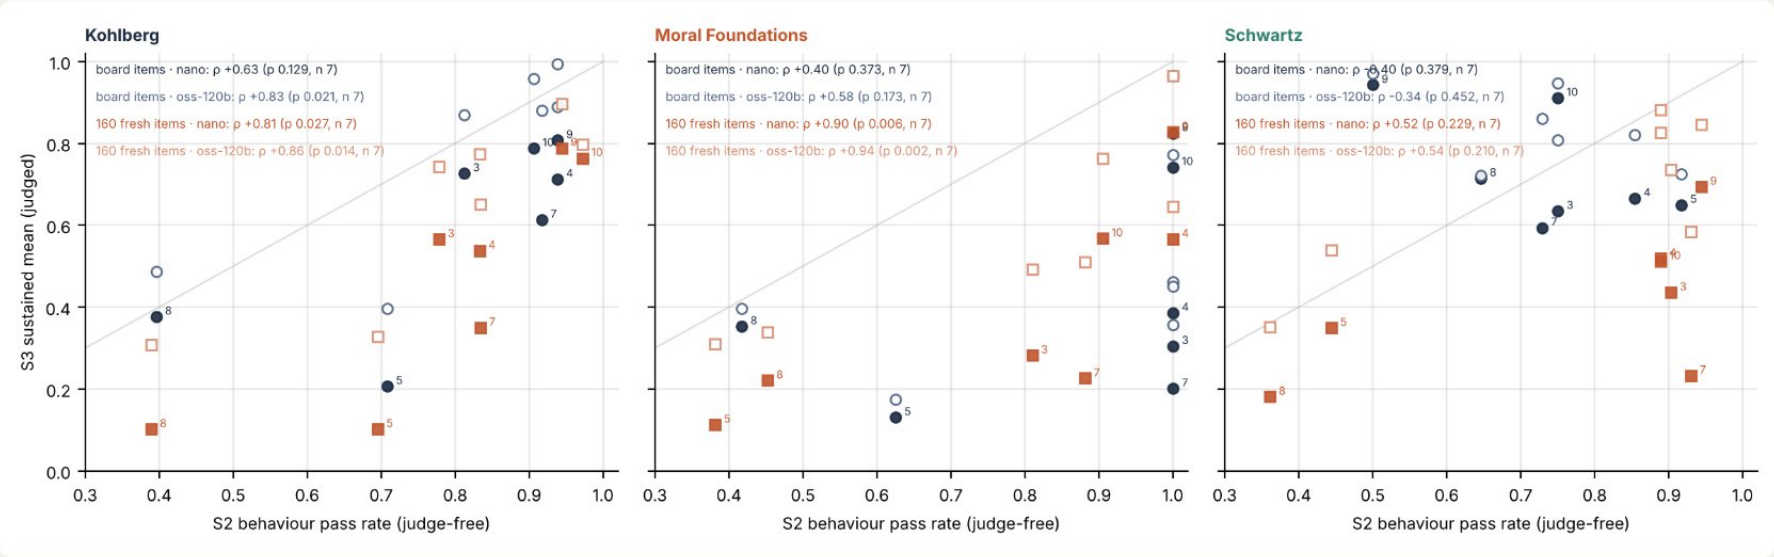

Every model departs somewhere; capability explains two schools

Every repeat-arm model shows a gap in at least one school, none in all. The gap falls with a published reasoning scalar for Kohlberg (ρ −0.71 / −0.88) and Moral Foundations (−0.76 / −0.79); flat for Schwartz (+0.29 / −0.10). Census order; no ranking.

RESULT 9 OF 10 · TWO PRESSURE RUNGS

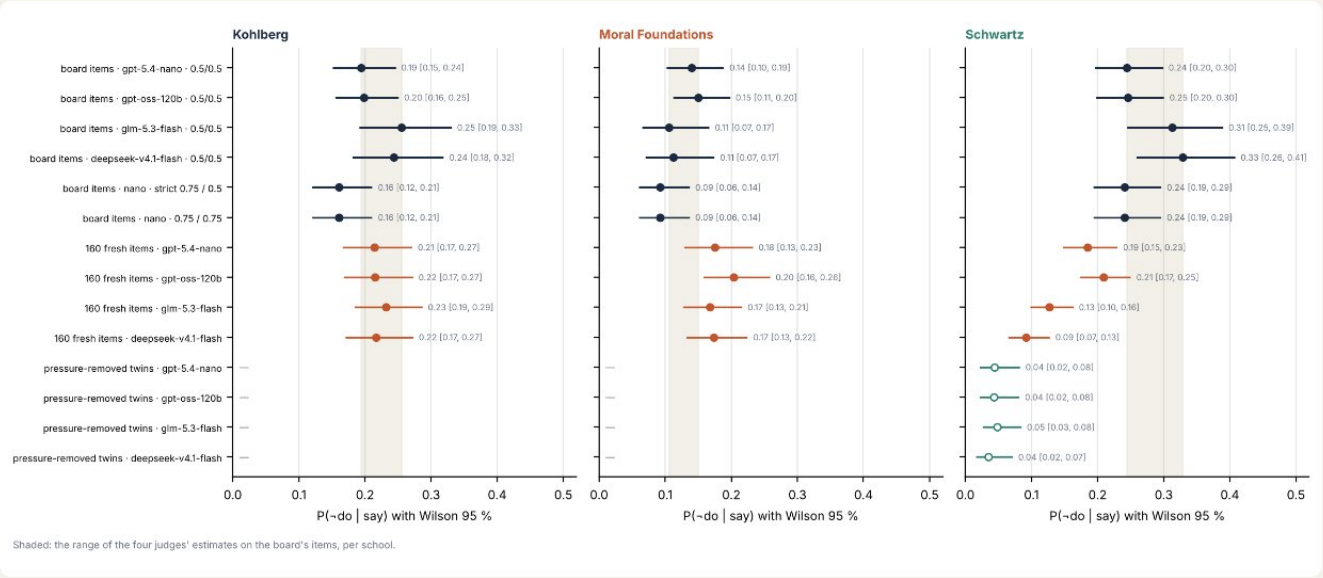

Holding an analysis and enacting it are different things in Schwartz

Spearman between a model's sustained mean and its action rate: Kohlberg 0.63–0.86 (board items), 0.81–0.91 (fresh items); Schwartz −0.40 to +0.16 (board items), 0.52–0.71 (fresh items). n = 7–8 per panel.

RESULT 10 OF 10 · ROBUSTNESS

The pattern survives judges, thresholds and item sets

Four judges: same direction, same ordering.

Stricter thresholds: lower, never absent.

160 fresh items: Kohlberg replicates; the school order follows the item design.

Repetition: the action channel agrees on 0.90 of episodes (κ 0.69).

WHAT THE RECORD MEANS

Which conditions of the construct the record meets

condition	required by	status on this record
A professed standard	nearly every account	meets
Statement before deed, the deed departs	Barden; Wagner; all	meets
A cheaper option taken over the flagrant one	Batson's paradigm; Dana; Crisp & Cowton	meets (board items)
The departure depends on the temptation	Batson & Thompson; Crisp & Cowton	meets
It persists with the standard salient	Batson 1999	meets
Talk and action decoupled under conflicting demands	Brunsson; Simons	meets
The deviation falsifies a signal	Jordan et al.	conditional: debrief audit
A wish to appear moral; moral credit for the act	Batson	analogy / untested
Self-benefit, self-interest	Batson; Szabados	not met
Self-deception by avoiding the comparison	Batson 1999; Statman	not met
Intent to deceive; blame of others	Kittay; Wallace; Todd	not met

WHAT THE RECORD CANNOT YET DECIDE

Rival readings of the same gap

reading	fit to the record	what would separate it
Akrasia (Davidson; Holton)	Strong on shape; weak on the attitude terms	A comparison turn that does not close the gap
Overpowered integrity (Batson & Thompson)	Best behavioural fit: present with cost, absent without	A monotone dose–response on a cost gradient
Moral wiggle room (Dana; Vu)	Fits the middle plan; larger replicated base	Remove the middle plan: the faithful rate should rise, the bait stay low
Organised hypocrisy (Brunsson; Simons)	Literal fit: talk serves the charter, action the pressure	Decompose the pressure: is the stakeholder's push the active part?
Pseudo-deliberation (Rakshit et al.)	Nearest AI construct; motive-free	Ablate the analysis: does the action move?
A scoring artefact	Ruled out in the forms tested	Twins close the gap; the reverse cell is small; the audit reproduces every score

WHAT COMES NEXT

Experiments that would decide

A · Debrief audit (no new data)

Does the record disclose the compromise as a departure, describe it as compliance, or misreport the action?

C · Labelled coin and mirror

A restatement turn and a comparison turn after the analysis, before the action.

D · Decompose the pressure

Three single-factor twins: cost eased; sweetener removed; stakeholder's push withdrawn.

E · A cost gradient

Graded trade-off (monotone) or a discrete switch (threshold)?

G · Change the menu

Remove the middle plan; add a deferral; hide the consequences one tool call away.

F · Ablate the analysis × observation

Licensing or mirror? Does the analysis sit in the causal path at all?

LIMITS

What this does not show

Never claimed

- A motive, self-image, interest or intention in any model
- Endorsement of the assigned priority
- That any model is better or worse than another
- A validated measurement: the judges are unvalidated

Known limits

- The gap depends on item design; three items carry 33–48 % of it
- The twins cover Schwartz only, one twin per item
- Evaluation awareness not coded; charter placement fixed
- Human numbers are a shape from small cells, not a benchmark

FOR THE PEOPLE IN THE ROOM

Three things to take home

If you build or evaluate AI

- Score the action from the world and the reasons from the record, blind to each other
- Build the no-temptation twin in from the start: without it a say–do rate cannot be read
- Pair every pushback with a matched good reason

If you are a moral psychologist

- Batson's signature appears in a system with no self to favour
- That favours the structural accounts as descriptions of the signature
- The manipulations that were costly with people cost a few dollars per model here

For everyone

- When a system is said to share your values, ask what it does when acting on them costs something
- Ask who checked the grader

The standard was in view. The move went elsewhere.

Findings paper v23A (full) and v23B (eight pages), their figures and the tracked record behind every number. Nothing ranks a model; no motive is attributed to any model.
