COMBINED WORKSTREAM RANKING · SAY-DO AND MORAL-HYPOCRISY LANES · 2026-11-05

One list for both lines: the say–do and moral-hypocrisy workstreams, merged and force-ranked by return

Built from `reports/C3_combined_workstreams_force_ranked.md` by `analysis/build_report_pdf.py`. Every judged number cited here is a property of the instrument under named, unvalidated language-model judges; models are named in sealed census order and never ranked.

Contents

Summary
1. How the two proposals were put on one scale
2. The force rank
3. What the ranking says
4. The ten, in the order to run them
5. Outside the ten: what to start in parallel, and what comes next
6. What the ten would let the papers say
7. Caveats

Combined workstream ranking (C3) · 2026-11-05 · Multi-Alignment / Moral_Psychology-Paper · source: the say–do workstream proposal (A3, `say-do/reports/A3_say-do_workstreams_roi.md`) and the moral-hypocrisy workstream proposal (B3, `moral-hypocrisy/reports/B3_moral-hypocrisy_workstreams_roi.md`), whose impact ratings, person-days and cash estimates are used as given; scoring by `analysis/c3_rank_workstreams.py`, output `analysis/out/c3_workstream_rank.json` · planning arithmetic, not a measurement: no model is called and no model is ranked · every paid step still needs its own grant, probe and stopping rule under lane law · PROVISIONAL · judges UNVALIDATED · no ranking.

Summary

A3 proposed eighteen workstreams for the say–do line and B3 sixteen for the moral-hypocrisy line. After merging the six workstreams that both describe, splitting two that bundle separable tests, and setting aside one conditional item and one that B3 folds into another, the two lists give 29 distinct workstreams. They were scored by two different rules: A3 counted $25 of spend as one person-day and B3 counted $100. This report puts every workstream on one rule (impact × breadth × 10 ÷ cost units, with $50 as one person-day and a 1.25 credit for work both papers need) and force-ranks all 29 with no ties. It then checks the order under eighteen variants of the rule's three arbitrary choices.

The recommendation is the ten best-ranked workstreams whose impact is at least 3 (Table 1). Together they cost about 24.5 person-days and $68 in expected metered spend (cap $88), and they fit in four calendar weeks with three small grants. Eight of the ten stay in the top ten in at least fourteen of the eighteen scoring variants. The last two places are contested, and the contest turns on one choice. The disclosure arm holds its place whenever impact counts linearly and loses it whenever decisive work is weighted more, when the option-set manipulation takes it.

Three findings about the combined list matter more than any single rank:

- **The priority-reversed twins come first among the substantive workstreams, and they are a gate.** If models take the middle plan at the same rate whichever way the charter states the priority, then the charter plays no role. Both framings would then lose their premise: the say–do paper's "assigned priority" and the hypocrisy paper's

"charter–action gap". Every charter-dependent arm should wait on that result, which costs about $8 and three person-days.

- **Cheap analyses of data already collected dominate the top of the list.** Three of the ten cost a dollar or less, none costs more than $16, and none takes more than four person-days. The disclosure audit is the most valuable of them, because it decides the vocabulary of both papers.
- **The four highest-impact metered arms rank in the middle, not the top.** These are the routing arm, the option-set manipulation, the single-factor pressure twins and the expert read. Each is rated 5 for impact, but each costs six to ten person-days, or carries honoraria. They are the next tranche, not the first, with one exception argued in §5: the expert read's recruitment should start now because its lead time is longer than the whole first tranche.

Table 1. The ten recommended workstreams, in the order to run them (§4 gives the schedule, with where each runs). "Force rank" is the position in the full list of Table 3, which also contains one impact-2 item (the charter-form table, rank 1) that rides along with the first week's work instead of taking a slot. "Serves" is A for the say–do paper, B for the hypocrisy paper, A + B for both. Days are the lane's person-days. ROI uses the central rule of §1.

order	force rank	workstream	serves	impact	days	cash, expected (cap)	ROI
1	2	Priority-reversed twins on the sixteen Schwartz agentic items (A3 W2 (one of its three sets) + B3 W11)	A + B	5	3	$8 ($10)	19.8
2	3	Judge-ceiling table beside every reverse rate, and the fifth judge family extended to the Kohlberg and MFT agentic records (A3 W17)	A	3	1.5	$1 ($2)	19.7
3	4	Structured intended-action field beside the judged record (the extraction-artefact check) (A3 W12 + B3 W12)	A + B	3	2	$8 ($10)	17.4
4	5	Post-action re-description and self-versus-other verdicts (Batson's third component) (B3 W8)	B	4	2	$16 ($20)	17.2
5	6	Disclosure audit of the say-not-do records: disclosed, re-described or misreported, with the record-call order (A3 W4 + B3 W1)	A + B	5	4	$0 ($0)	15.6
6	7	Middle-plan sensitivity table and a cluster bootstrap over items × models (A3 W15)	A	3	2	$0 ($0)	15.0
7	8	Advance self-prediction of the middle plan, per item and model (A3 W8)	A	3	2	$3 ($6)	14.6
8	9	Disclosure arm: the record must say whether the plan follows the priority (B3 W2)	B	3	2	$8 ($10)	13.9
9	10	Hidden-consequences menu: the protected party's outcome one free tool call away (the Hua 2026 test) (B3 W7 (variant 3, split out))	B	4	3	$8 ($10)	12.7
10	11	Salience arms: restate the priority, or compare the plan with it, before acting (B3 W3)	B	4	3	$16 ($20)	12.1

1. How the two proposals were put on one scale

Impact. Both proposals rate impact from 1 to 5 with anchors that line up. In A3, 5 means the work decides a mechanism question the paper leaves open or turns an argued-around threat into evidence. In B3, 5 means it decides whether the word "hypocrisy" may be used, or supplies the validity a psychology venue requires. At 4, A3 closes a named reviewer objection or reaches a new population, and B3 separates two rival readings or answers a council MAJOR. At 3, both strengthen a claim already made. At 2, both mean disclosure or robustness, and at 1 both mean cosmetic. Each paper's 5 is therefore "decides a central open question of that paper". A workstream keeps its source rating, and a merged one takes the higher of its two ratings.

Breadth. Six workstreams are proposed by both A3 and B3. Run once, each serves both papers, so it carries a breadth credit of 1.25. Breadth is credited only where both proposals actually asked for the work. A workstream that one proposal asked for and the other paper might also use gets no credit, because that would be this report's judgment rather than the proposals'.

Cost. Cost units are person-days plus cash divided by $50. The rate sits between A3's $25 and B3's $100. Person-days are the lane's own time, as both proposals counted it. Cash is the expected figure, while the cap governs grants. Honoraria and participant payments count as cash at the same rate as metered spend, since the lane has one budget.

Return and the force rank. ROI = impact × breadth × 10 ÷ cost units. Rows are ordered by ROI rounded to two decimals. A tie goes to the higher impact, then the lower cash, then the row that more workstreams depend on, so the order is strict. A3's own caution still holds: two rows within a factor of 1.5 of each other differ by less than the precision of their estimates, and §4 orders them by sequencing.

Robustness. The rule has three arbitrary choices, so the ranking was repeated under 18 variants:

- the dollar rate at $25, $50 and $100;
- impact linear, or convex with 1, 2, 3, 5 and 8, which rewards decisive work more;
- the breadth credit at 1.0, 1.25 and 1.5.

Table 3 gives each row's best and worst rank across the variants, and how many of the 18 put it in the top ten.

Merging. When both proposals described the same work, the merged row takes the larger effort and cash estimate for the shared part, plus the increment for whatever only one proposal included. Table 2 records each merge. Two of B3's items were split or folded. Its menu manipulation (W7) shares two variants with A3's option-set arm, and its third variant, the hidden-consequences menu, is a separate test of a separate prediction, so it is ranked alone. Its cross-cultural quota (W15) is folded into the observer study's cap, as B3 recommends. A3's charter-placement arm (W7b) stays conditional on the charter-form table and is not ranked, as in A3.

Table 2. The merged and split workstreams, and how their figures were combined.

merged workstream	from	impact A3 · B3	days	cash, expected (cap)	how the figures were merged
Priority-reversed twins on the sixteen Schwartz agentic items	A3 W2 (one of its three sets) + B3 W11	5 · 4	3	$8 ($10)	B3's figures for one sixteen-twin set; A3 rated its twin bundle 5 for deciding whether the predicate reads the priority or the convenience, which is this set's question.
Structured intended-action field beside the judged record (the extraction-artefact check)	A3 W12 + B3 W12	3 · 3	2	$8 ($10)	A3's $0 pass on existing records through the audit matcher, then B3's one administration with the field; can share that administration with the post-action re-description.
Disclosure audit of the say-not-do records: disclosed, re-described or misreported, with the record-call order	A3 W4 + B3 W1	4 · 5	4	$0 ($0)	Union of A3's disclosed / claims-faithful / silent split with record-call order and B3's disclose / re-describe / misreport codes; one matcher; 3 + 3 days with the shared matcher counted once, plus a day for the second code set.
Hidden-consequences menu: the protected party's outcome one free tool call away (the Hua 2026 test)	B3 W7 (variant 3, split out)	— · 4	3	$8 ($10)	One of B3 W7's three variants, costed as one sixteen-item arm with a third of W7's authoring; rated 4 (separates two rival readings) where the three-variant W7 was rated 5.
Option-set manipulation: middle plan removed, exit option added, second middle plan added, on Schwartz and MFT items	A3 W3 + B3 W7 (variants 1–2)	5 · 5	6	$24 ($35)	A3's three menus on two schools; B3's removal and deferral variants are the same manipulations; B3's item-law authoring and audit extension add a day to A3's five.

merged workstream	from	impact A3 · B3	days	cash, expected (cap)	how the figures were merged
Single-factor pressure twins: cost-only, sweetener-only, push-only	A3 W2 (two factorial sets) + B3 W4	5 · 4	9	$24 ($30)	B3's three single-factor sets of sixteen twins; A3 priced two of them inside W2.
Expert read of the reasons channel, resumed, with a disclosure code and a third reader for the Schwartz middle plans	A3 W5 + B3 W13	5 · 5	5	$1,500 ($3,000)	B3's honoraria ($500–1,000 per reader) for two readers as the expectation, and A3's third reader in the cap; A3 counted the honoraria at the owner's discretion.
Human observer study: do people judge the model's gap as hypocrisy?	B3 W9	— · 5	20	$2,500 ($3,800)	The cap adds B3 W15's three-culture quota (≈ $1,300), which B3 folds into this study rather than ranking alone.

2. The force rank

Table 3. All 29 workstreams in one strict order under the central rule. ★ marks the ten recommended in Table 1. "Serves" names the paper the work was proposed for: A say–do, B hypocrisy, A + B both. Days are person-days. Cash is expected, with the cap in brackets. "Rank range" runs over the 18 scoring variants of $1, with the median in brackets, and "top ten in" counts the variants that put the row in the top ten. The ROI at $25 and at $100 per person-day is in the output file.

rank	workstream	from	serves	impact	days	cash, expected (cap)	ROI	rank range (median)	top ten in
1	Charter form (lexical or relative) and placement tabulated per item	A3 W7a	A	2	1	$0 ($0)	20.0	1–5 (3)	18/18
2	Priority-reversed twins on the sixteen Schwartz agentic items ★	A3 W2 (one of its three sets) + B3 W11	A + B	5	3	$8 ($10)	19.8	1–4 (1)	18/18
3	Judge-ceiling table beside every reverse rate, and the fifth judge family extended to the Kohlberg and MFT agentic records ★	A3 W17	A	3	1.5	$1 ($2)	19.7	2–6 (4)	18/18
4	Structured intended-action field beside the judged record (the extraction-artefact check) ★	A3 W12 + B3 W12	A + B	3	2	$8 ($10)	17.4	2–11 (5.5)	17/18
5	Post-action re-description and self-versus-other verdicts (Batson's third component) ★	B3 W8	B	4	2	$16 ($20)	17.2	2–6 (3.5)	18/18
6	Disclosure audit of the say-not-do records: disclosed, re-described or misreported, with the record-call order ★	A3 W4 + B3 W1	A + B	5	4	$0 ($0)	15.6	2–11 (4)	17/18
7	Middle-plan sensitivity table and a cluster bootstrap over items × models ★	A3 W15	A	3	2	$0 ($0)	15.0	5–11 (7)	16/18
8	Advance self-prediction of the middle plan, per item and model ★	A3 W8	A	3	2	$3 ($6)	14.6	6–12 (8)	14/18
9	Disclosure arm: the record must say whether the plan follows the priority ★	B3 W2	B	3	2	$8 ($10)	13.9	8–13 (10)	9/18
10	Hidden-consequences menu: the protected party's outcome one free tool call away (the Hua 2026 test) ★	B3 W7 (variant 3, split out)	B	4	3	$8 ($10)	12.7	6–10 (8.5)	18/18
11	Salience arms: restate the priority, or compare the plan with it, before acting ★	B3 W3	B	4	3	$16 ($20)	12.1	7–11 (11)	8/18
12	Analysis ablation crossed with observation (licensing or mirror)	B3 W6	B	4	3	$32 ($40)	11.0	8–15 (12.5)	3/18
13	Related-work section with the regime table and a judge-ceiling column	A3 W16	A	3	3	$0 ($0)	10.0	12–19 (16)	0/18
14	Evaluation awareness coded as a covariate in the existing records and debriefs	A3 W6	A	3	3	$3 ($6)	9.8	13–20 (17)	0/18
15	Option-set manipulation: middle plan removed, exit option added, second middle plan added, on Schwartz and MFT items	A3 W3 + B3 W7 (variants 1–2)	A + B	5	6	$24 ($35)	9.7	7–22 (13)	6/18
16	Post-capitulation re-elicitation on the sustained rung (sincere update or deference)	A3 W11	A	4	4	$8 ($15)	9.6	14–16 (15)	0/18
17	Reasoning-effort arm on the Schwartz agentic items	A3 W9	A	3	3	$25 ($50)	8.6	16–23 (21)	0/18
18	Release package: released items, predicates, harness and two-channel scoring code	A3 W18	A	4	5	$0 ($0)	8.0	16–20 (17)	0/18
19	Registered report in dialogue with Hua (2026)	B3 W16	B	4	5	$0 ($0)	8.0	17–21 (18)	0/18
20	Routing arm: the action must pass through the record (re-injected, truncated, reversed)	A3 W1	A	5	6	$20 ($40)	7.8	12–23 (16)	0/18
21	Cross-species base-rate arm: Batson's coin, Dana's wiggle room and the die roll as agentic episodes	B3 W10	B	4	5	$10 ($15)	7.7	20–22 (21)	0/18

rank	workstream	from	serves	impact	days	cash, expected (cap)	ROI	rank range (median)	top ten in
22	Planned owner-machine items: frontier repeats on the command-line routes and the gpt-5.6-sol re-judge	A3 W14	A	3	4	$0 ($0)	7.5	18–23 (22)	0/18
23	Single-factor pressure twins: cost-only, sweetener-only, push-only	A3 W2 (two factorial sets) + B3 W4	A + B	5	9	$24 ($30)	6.6	13–23 (20.5)	0/18
24	Cost gradient: the faithful plan's cost in three steps	B3 W5	B	4	8	$24 ($30)	4.7	24–24 (24)	0/18
25	Cross-benchmark concordance with WDCT, ValueActionLens, GAP and PropensityBench on the same models	A3 W10	A	4	10	$60 ($120)	3.6	25–26 (25)	0/18
26	Organizational-decoupling paper with organization theorists	B3 W14	B	3	12	$0 ($0)	2.5	26–27 (26)	0/18
27	Expert read of the reasons channel, resumed, with a disclosure code and a third reader for the Schwartz middle plans	A3 W5 + B3 W13	A + B	5	5	$1,500 ($3,000)	1.8	25–28 (27)	0/18
28	Human comparison arm: participants do the released items	A3 W13	A	4	15	$800 ($1,500)	1.3	27–28 (28)	0/18
29	Human observer study: do people judge the model's gap as hypocrisy?	B3 W9	B	5	20	$2,500 ($3,800)	0.7	29–29 (29)	0/18

3. What the ranking says

The top is cheap and analytic, and it is stable. The first eleven rows cost between $0 and $16 each and one to four person-days. Eight of the recommended ten are in the top ten in at least fourteen of the eighteen variants, and the reversed twins never fall below fourth. Neither proposal's own rule would change that: at $25 per person-day and at $100, the same eight lead. The ranking is not sensitive to the choice of rate because, for these workstreams, person-days and not dollars dominate the cost.

The tenth place is genuinely contested. The disclosure arm (rank 9) and the salience arms (rank 11, tenth among eligible rows) hold the last two places under the central rule. But they are in the top ten in only 9 and 8 of the 18 variants, and the split is clean. The disclosure arm is in the top ten in all nine variants that count impact linearly and in none that weight it convexly. The option-set manipulation (rank 15, impact 5, serves both papers) is the mirror image: it is in the top ten in six convex variants and in no linear one. The analysis ablation (rank 12) enters only at the $100 rate with convex impact. So the tenth place is a choice about values, not arithmetic. If the lane would rather buy one decisive experiment than two cheaper partial ones, the option-set manipulation replaces the disclosure arm. That swap costs four more person-days and $16 more expected spend. The disclosure arm also depends on the salience result, as B3 notes, so it is the less independent of the two.

The high-impact arms are the second tranche. The routing arm (rank 20), the option-set manipulation (15), the single-factor pressure twins (23) and the cost gradient (24) each answer a mechanism question, but each takes six to nine person-days of authoring, driving and analysis. Under convex impact the option-set manipulation and the routing arm rise to ranks 7 and 12 at best. The pressure twins rise to 13 at best. None reaches the top ten under the central rule. They follow naturally once the reversed twins have shown that the charter is doing work.

Human work ranks last on return, and that is the wrong signal to act on. The expert read (rank 27), the human comparison arm (28) and the observer study (29) rank last because their cash dwarfs every metered arm. B3 prices the observer study at about $2,500 against $8 for a sixteen-item arm. Their value is not in doubt, however. The expert read is the only route to a validity statement about the judged channel in either paper. The observer study is the only way to measure, rather than assert, that people would call the gap hypocrisy. Both are bottlenecked by calendar time (recruitment, ethics review), not by lane days. §5 treats them as parallel tracks to open now.

Shared work is rare at the top, and that is useful to know. Three of the six workstreams both proposals asked for are in the recommended ten: the reversed twins, the disclosure audit and the structured intended-action field. The other three shared ones (the option-set manipulation, the pressure twins and the expert read) are expensive. The two papers need different evidence beyond the shared core, so the plan should not assume one programme serves both papers for free.

4. The ten, in the order to run them

Table 4. A four-week schedule for the ten, with the charter-form table riding along. "Grant" is a separate metered ask with its own probe and stopping rule. Expected spend per grant sums the rows it covers.

week	$0 track (here and owner machine)	metered track	decision point
1	Disclosure audit on the owner machine (4 days). Judge-ceiling table and sensitivity table with cluster bootstrap here (3.5 days). Charter-form table (1 day). Author the reversed twins and the hidden-consequences menu under the item law, and write the instruction variants for the structured field, the post-action questions and the two salience arms. Generate the self-prediction probe from the tool manifests.	none	the audit's split decides the vocabulary of A2 and B2
2	Validate the twins and the new menu read-only; extend the predicate audit to the new menu	grant 1, about $36: reversed twins; structured field and post-action re-description in one shared administration; self-prediction probe; the fifth judge family on the remaining agentic records	reversed twins: does the charter do work? If not, stop the charter-dependent arms and re-plan
3	Analysis of grant 1	grant 2, about $24: the two salience arms; the hidden-consequences menu	salience: labelled coin or mirror
4	Revise A2 and B2 with the results; draft the next version of the findings paper's §5.3	grant 3, about $8: the disclosure arm, written in the light of the salience result	whether to open the second tranche (§5)

Two features of this order are deliberate. First, nothing that presupposes the charter runs before the reversed twins report, except the three items that share grant 1 with them: the structured field, the post-action questions and the self-prediction probe. If the twins come back null, those three still answer their own questions about extraction, self-rating and self-knowledge. Second, the disclosure audit runs in week 1 because three later items read its codes: the disclosure arm, the observer study's disclosed and undisclosed cells, and the expert read's disclosure column. It costs no cash.

5. Outside the ten: what to start in parallel, and what comes next

Start now, in parallel: the expert read's recruitment. It ranks 27th on return, but its lane cost is five person-days. Its calendar cost is three to four weeks of recruitment, which is as long as the whole first tranche. A3 puts it in its first tranche, and B3 says to start it now, for that reason. The packet is drawn and sealed, the protocol is fixed and the ethics are prepared. Opening recruitment in week 1 does not take a slot from the ten. The A-26 STOP-and-ask applies before any of its numbers is used.

Open the ethics application for the observer study if the hypocrisy paper is going to a psychology venue. If B2's framing survives the disclosure audit and the reversed twins, a psychology venue will ask for the observer study. Its ethics review is eight to twelve weeks long, so the application is the one human-study step worth starting before the evidence is in. If the paper is aimed at a machine-learning venue, defer it.

The second tranche, after week 4. The next eight workstreams of impact 4 or 5, in rank order (ranks 12 to 23):

1. **Analysis ablation crossed with observation** (rank 12): the cheapest test of licensing against the mirror.
2. **Option-set manipulation** (rank 15): the within-instrument test of the option-set claim both papers make.
3. **Post-capitulation re-elicitation** (rank 16): turns the sycophancy result into a belief test.
4. **Release package** (rank 18): opens the datasets-and-benchmarks venue.
5. **Registered report with Hua** (rank 19): needs the hidden-consequences menu and the base-rate arm first.
6. **Routing arm** (rank 20): decides between a priority stated and not enacted and one that never entered the decision.
7. **Base-rate arm** (rank 21): puts human and model rates on one option set.
8. **Single-factor pressure twins** (rank 23): un-bundles the pressure. B3's suggestion to merge them with the cost gradient into one factorial authoring campaign of about 112 twins is worth taking if both are wanted.

With the full second tranche, the lane would have a mechanism claim (routing), an option-set claim (manipulation) and a decomposed pressure claim (single-factor twins), which A3's rubric counts as main-track material.

Later or conditional. The reasoning-effort arm, the evaluation-awareness covariate, the owner-machine repeats, the related-work section (needed before any submission but not urgent), the cross-benchmark concordance, the organizational-decoupling paper and the human comparison arm follow when a venue or a reviewer asks. The charter-placement arm runs only if the charter-form table finds the charters placed uniformly.

6. What the ten would let the papers say

With the ten landed, the say–do paper (A2) and the hypocrisy paper (B2) can each replace hedged sentences with results:

- **The charter's role is measured.** The reversed twins measure it rather than assume it. A null retires both framings early and cheaply. A clear result supports both papers' premise at once.
- **The vocabulary is settled by data.** The disclosure audit settles it in both papers. A mostly-disclosed split keeps motive-laden words out for good, and B2's "structural hypocrisy" reading weakens, because Jordan et al.'s honest hypocrite is not penalised. A mostly-silent split supports B2's false-signal condition and A2's monitoring implication, with a count beside each.
- **The "say" channel's limits are quantified.** The judge-ceiling table, the fifth judge across three schools, the structured field and the sensitivity table say how much of the gap depends on how "say" is graded and on how the middle plan is scored.
- **Batson's components become tests.** The salience arms (mirror or labelled coin), the post-action re-description (the missing third component) and the hidden-consequences menu (the wiggle-room test of Hua's prediction) turn B2's mapping onto Batson's taxonomy from analogy into tested components.
- **Self-knowledge of the compromise is measured.** The self-prediction probe says whether models can foresee their own compromise, a question A2 currently leaves open.

None of the ten ranks a model or measures a value profile. Each keeps the competence framing and every judged number under unvalidated judges, as A3 and B3 require.

7. Caveats

- **The inputs are estimates.** The impact ratings, person-days and cash come from two proposals written in parallel by separate authors from the same record. Their calibration may differ: B3 rates the decisive human work 5 more readily than A3 rates its human arm. The robustness grid covers the rule's choices, not the ratings themselves.
- **ROI is a ranking device, not a measurement.** Differences under a factor of 1.5 are within the precision of the estimates. The two contested places are named for that reason.
- **Merged and split rows carry this report's arithmetic.** Their figures are documented in Table 2: the reversed twins as one of A3's three twin sets, the hidden-consequences menu as one of B3's three menu variants, and the expert read's cap including A3's third reader.
- **The recommendation applies one rule beyond the arithmetic.** An item rated below 3 rides along instead of taking a slot. With the charter-form table counted, the force rank's top ten would drop the salience arms.
- **Nothing here is a grant.** Every metered step needs its own grant, probe and stopping rule. The expected spend of the ten, about $68, is a planning figure against a programme that has spent about $220 on metered calls so far: about

$28 for the repeat arm and $190 for the four further arms, per article v2's scale and cost paragraph.
